## Solar butterflies set

Danaus plexippus

Ornithoptera priamus euphorion

This set contains 2 solar butterflies (but only one solar cell + motor) with a size of approx. 9x7x2 cm. These consist of a plastic casing with metal legs, on the top side there is a solar cell, which drives an electric motor with an imbalance, mounted in the casing. The wings are designed with a nice colouring.

If the solar cell is illuminated by sunlight or light of halogen spot lights, the butterflies vibrate and hop round on a plain surface. They can also be held in hand, the vibration is perceptible.

The set is delivered as a construction kit and has to assembled before the first use, a manual is included.

As a light source the natural sunlight is ideal, inside a room a halogen lamp is suited best as a light source. LED lamps or LED flashlights are not suitable because of the altered light spectrum.
